IT IS A BONE REMODELLING DISCADER MITH CLIMICAL SIMILARITIES TO FEO. UNLIKE FEO, HOWEVER, AFFECTED INDIVIDUALS HAVE INVOLVEMENT OF THE AXIAL SKELETON WITH LESTONS IN THE SPINE, PELVIS AND SKULL. SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GLAND.

DISEASE: DEFECTS IN THERSELLA ARE THE CAUSE OF EAMILIAL EXPLOISEASE: DEFECTS IN THERSELLA DOMINANT BONE DISCREER OSTEDLYSIS (PEO), A RARE AUTOSOMAL DOMINANT BONE REMODELLING.

CHARACTERIZED BY FOCAL AREAS OF INCREASED BONE REMODELLING.

CSTEDLYTIC LESIONS DEVELOP USUALLY IN THE LONG BONES DURING ADULTHOOD. FEO IS OFTEN ASSOCIATED WITH EARLY ONSET DEAFNESS

LOSS OF DENTITION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FUNCTION: RECEPTOR FOR RANK LIGAND (RANKL; ALSO KNOWN AS OSTEOCLAST DIFFERENTIATION FACTOR OR ODF), ESSENTIAL FOR RAMEDIATED OSTEOCLASTOGENESIS. INVOLVED IN THE REGULATION OF INTERACTIONS BETWEEN T-CELLS AND DENDRITIC CELLS.
SUBGELLULAR LOCATION: Type I membrane protein (Potential).
TISSUE SPECIFICITY: UBIQUITOUS EXPRESSION WITH HIGH LEVELS SKELETAL MUSCLE, THYMUS, LIVER, COLON, SMALL INTESTINE AND

SUBCELULIAR LOCATION: Type I membrane protein (Potential).
TISSUE SPECIFICITY: UBIQUITOUS EXPRESSION WITH HIGH LEVELS
TRABECULIAR BONE, THYMUS, SWALL INTESTINE, LUNG, BRAIN AND K
WEAKLY EXPRESSED IN SPLEEN AND BONE MARROW.
SIMILARITY: CONTAINS 4 THER-CYS REPEATS.
                                                                                                                                                                                                                                                                                                                                                       PS50050;

Used to treat moderate to servere rheumatoid arthritis (RA). Enbrel consist of the extracellular ligand-binding portion of TNFR2 linked to an Immuglobulin Fc chain. It binds to TNF-alpha and blocks its interactions with receptors. SIMILARTY: CONTAINS 4 TWRR-CYS REPEATS.

SUBUNIT: CAN FORM A HOMODIMER THROUGH DISULFIDE BOND FORMATION.

SUBCELLULAR LOCATION: Type I membrane protein.

PYM: N- AND O-GLYCOSYLATED AND IS PHOSPHORYLATED ON SERINE.

SIMILARITY: CONTAINS 4 TNFR-CYS REPEATS.

SIMILARITY: CONTAINS 1 DEATH DOMAIN.

No. is the number of results predicted by chance to have score greater than or equal to the score of the result being part and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence encodes the full-length cell surface receptor ACT-4 isolated from activated CD4+ T-lymphocytes. The sequence may be expressed in e.g. COS-7 cells. The encoded protein, its ilgands or fragments, and antibodies may be used for the treatment of transplant rejection, graft-versus-host disease, autoimmune disease, etc.

                                                                                                                                                                                                                                                                                                                                                 ACT-4-L-h-1 is a specific binding partner (sbp) to the ACT-4 receptor polypeptide (encoded by this sequence) on the surface of activated CD4 positive B cells. The sbp and its fragments are useful in pharmaceutical compositions to modify a patient's immune response as well as having application in the treatment of transplant rejection, graft versus host disease, autoimmune disease, inflammation, infectious agents, HTLV infected cells or HIV. Specifically the sbd can be used to treat inflammatory bowel disease. The sbd can also be used for screening for immunomodulatory agents able to recognise ACT-4 and for monitoring activated CD4 positive cells or inhibiting infection of CD4 positive cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ligand,

CC factor (TNF) related apoptosis inducing ligand (TRAIL) receptor without CC intracellular domain, also referred to as tumour necrosis factor CC receptor 5 (TNF) solvents, and referred to as tumour necrosis factor CC receptor 5 (TNFR)-5 or TRS)). TRID has cytostatic, immunosuppressive, CC nootropic, neuroprotective, antiviral, antiinflammatory, anticonvulsant, CC antiparasitic, cardiant, anti-HIV, antiparkinsonian and vasotropic activities, and can be used in gene therapy. The TRID polynucleotides CC are useful for detecting complementary polynucleotides. TRID proteins and CC polynucleotides are useful in the treatment of tumours, resistance to CC parasite, bacteria and viruses, restenosis and graft versus host disease. CC They are also useful for inducing proliferation of T-cells, endotheilal CC ells and certain haematopoletic cells, to regulate antiviral responses CC and to prevent certain autoimmune diseases after stimulation of TRID by CC an agonist or TRAIL binding facilitator. The antibodies which bind TRID CC associated with increased or decreased apoptotic cell death. The TRID CC useful in the diagnosis, treatment or prevention of: (a) cancer; CC useful in the diagnosis, treatment or prevention of: (a) cancer; CC is autoimmune discases associated with increased CC apoptosis; (d) cardiovascular disorders; and (e) viral infection. The presents a tumour necrosis factor receptor used in CC comparison with TRID in the exemplification of the present invention.

C the OX-40 antigen was identified (expressed on the surface of activated autoantigen-specific CD4+ T-cells present at the site of inflammation but absent on CD4+ T-cells at non-inflammatory sites) C and cDNA encoding the antigen was isolated. PCR primers were designed and used to clone murine OX-40 cDNA by PCR from RNA C isolated from murine CD4+ T-cells activated with concanavalin A. C Then the murine OX-40 cDNA was used to probe a cDNA lambda gtl1 C library from human activated T lymphocytes to obtain human OX-40 cDNA. The published patent application states that the OX-40 cDNA c sequence is also in SQ ID no. 1, but this sequence is not present in the spec. A nucleic acid having the sequence in SQ ID no 1 and C the polypeptide encoded by it are claimed.
                                                                                                                                                                                                                                                                antigen activated \tilde{T}-cells, especially, for example, CD4+ T-cells. A human CDNA encoding the human OX-40 homologue was cloned as follows. Using the Experimental Autolumnune Encephalomyelitis model in rats the OX-40 antigen was identified (expressed on the surface of
                                                                                                                                                                                                                                                                                                                                                                                                       Claim 3; Fig 11; 91pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   multiple sclerosis;

                                                                                                                                                                                                                                                  The present sequence represents the OX40/Fc fusion protein that contains the extracellular domain of mouse OX40 fused to the mutated Fc region of the human IgGl antibody. The fusion protein was used for detecting cDNA clones encoding an OX40 ligand. The invention claims for a murine OX40-L cytokine (AAW48975) that binds to the murine T cell antigen, OX40. The OX40-L protein is claimed to be useful for co-stimulation of T-cell production and in binding assays for detecting OX40 or its homologues. The OX40-L protein is also claimed to generate a TH-2 immune response.
                                                                                                                                                                                                                      Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method for treating conditions leading CC to bone loss. The method comprises administering a purified and isolated osteoprotegerin (OPG) protein (AAF57836-AAF57838 and AAB66974-AAB66976) CC in conjunction with other substances such as tumour necrosis factor-alpha CC (TNF-alpha) inhibitors, interleukin (II)-6, -8 and -18 inhibitors, ICE CC modulators, fibroblast growth factor (FGF)1-10 modulators and/or platelet CC activating factor (PAF) antagonists. The method is useful for treating CC conditions leading to bone loss such as rheumatoid arthritis, multiple CC sclerosis, osteoporosis, osteopyelitis and asthma. The method is also CC useful for treating inflammation, systemic lupus crythematosus (SLE) and Graft-versus-host disease (GvHD). Other diseases that can be treated CC include acute pancreatitis, Alzheimer's disease, anorexia, CC annear, diabetes, endometriosis, fever, glomerulonephritis, hyperalgesia, CC inflammatory bowel disease, ischaemia, pain, Parkinson's disease, concared concared to the present sequence was used in a sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
